- HIGH AMR
- HIGH RECOVERED AUDIO
- GOOD CAPTURE RATIO
- LOW DISTORTION
- MUTING CAPABILITY

PRELIMINARY DATA

The TDA 1200 is a silicon monolithic integrated circuit in a 16-lead dual in-line plastic package. It provides a complete subsystem for amplification of FM signals.

The functions incorporated are:

- FM amplification and detection
- interchannel controlled muting
- AFC and delayed AGC for FM tuner
- switching of stereo decoder
- driving of a field strength meter

The TDA 1200 can be used for FM-IF amplifier application in HI-FI, car-radios and communication receivers.

NOTES: (1) When V_s is less than 12 V, a resistor $R_8 = 12 \text{ k}\Omega$ must be connected between audio output and ground, and the integrator capacitor C_5 must be changed to 10 nF, as follows:
