**14-stage binary ripple counter with oscillator****74HC/HCT4060****FEATURES**

- All active components on chip
- RC or crystal oscillator configuration
- Output capability: standard (except for  $R_{TC}$  and  $C_{TC}$ )
- $I_{CC}$  category: MSI

**GENERAL DESCRIPTION**

The 74HC/HCT4060 are high-speed Si-gate CMOS devices and are pin compatible with "4060" of the "4000B" series. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4060 are 14-stage ripple-carry counter/dividers and oscillators with three oscillator

terminals ( $RS$ ,  $R_{TC}$  and  $C_{TC}$ ), ten buffered outputs ( $Q_3$  to  $Q_9$  and  $Q_{11}$  to  $Q_{13}$ ) and an overriding asynchronous master reset (MR).

The oscillator configuration allows design of either RC or crystal oscillator circuits. The oscillator may be replaced by an external clock signal at input RS. In this case keep the other oscillator pins ( $R_{TC}$  and  $C_{TC}$ ) floating.

The counter advances on the negative-going transition of RS. A HIGH level on MR resets the counter ( $Q_3$  to  $Q_9$  and  $Q_{11}$  to  $Q_{13}$  = LOW), independent of other input conditions.

In the HCT version, the MR input is TTL compatible, but the RS input has CMOS input switching levels and can be driven by a TTL output by using a pull-up resistor to  $V_{CC}$ .

**QUICK REFERENCE DATA**

$GND = 0 \text{ V}$ ;  $T_{amb} = 25^\circ\text{C}$ ;  $t_r = t_f = 6 \text{ ns}$

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
$t_{PHL}/t_{PLH}$	propagation delay $RS$ to $Q_3$	$C_L = 15 \text{ pF}$ ; $V_{CC} = 5 \text{ V}$	31	31	ns
	$Q_n$ to $Q_{n+1}$		6	6	ns
	$MR$ to $Q_n$		17	18	ns
	$f_{max}$		87	88	MHz
$C_I$	input capacitance		3.5	3.5	pF
$C_{PD}$	power dissipation capacitance per package	notes 1, 2 and 3	40	40	pF

**Notes**

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu\text{W}$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

$f_i$  = input frequency in MHz

$f_o$  = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$  = sum of outputs

$C_L$  = output load capacitance in pF

$V_{CC}$  = supply voltage in V

2. For HC the condition is  $V_I = GND$  to  $V_{CC}$

For HCT the condition is  $V_I = GND$  to  $V_{CC} - 1.5 \text{ V}$

3. For formula on dynamic power dissipation see next pages.

**Notes**

1. The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given here.  
To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.
2. Only input MR (pin 12) has TTL input switching levels for the HCT versions.

## RC OSCILLATOR

Typical formula for oscillator frequency:

$$f_{osc} = \frac{1}{2.5 \times R_t \times C_t}$$

Fig.10 Example of a RC oscillator.

## TIMING COMPONENT LIMITATIONS

The oscillator frequency is mainly determined by  $R_t C_t$ , provided  $R_2 \approx 2R_t$  and  $R_2 C_2 \ll R_t C_t$ . The function of  $R_2$  is to minimize the influence of the forward voltage across the input protection diodes on the frequency. The stray capacitance  $C_2$  should be kept as small as possible. In consideration of accuracy,  $C_t$  must be larger than the inherent stray capacitance.  $R_t$  must be larger than the "ON" resistance in series with it, which typically is 280 Ω at  $V_{CC} = 2.0$  V, 130 Ω at  $V_{CC} = 4.5$  V and 100 Ω at  $V_{CC} = 6.0$  V.

The recommended values for these components to maintain agreement with the typical oscillation formula are:  
 $C_t > 50$  pF, up to any practical value,  
 $10$  kΩ <  $R_t$  <  $1$  MΩ.

In order to avoid start-up problems,  $R_t \geq 1$  kΩ.

**TYPICAL CRYSTAL OSCILLATOR**

In Fig.11, R2 is the power limiting resistor.  
For starting and maintaining oscillation a minimum transconductance is necessary, so R2 should not be too large. A practical value for R2 is 2.2 k $\Omega$ .
